1 Introduction

This user guide tells you how to perform Mycore-Sample-Apllication combined with the implementation of Tamino4 on Windows XP Professional. It is written for open source project "MILESS/ MyCoRe" (http://www.mycore.de)", and especially for those who want to implement XML native database to the mycore sample application. Tamino4 is a software product for XML: DB native database, which developed by Software AG (http://www.softwareag.com/tamino/default.htm). It enables XML documents to be stored, queried, and managed in native XML format.

This guide includes four parts: Introduction, Organizing Mycore Environment, Peparing Mycore Codes, and Implementation Steps for Mycore Application.

2 Organizing Mycore Environment

To perform Mycore application on WinXP, the following software is required:

- Tamino4: for the MyCoRe XML persistence. S. the separate installation guide
- MySql: for the Storage of Mycore Classification.

MySql: Download, Installation and Usage

Download mysql zip file from

http://www.mysql.com/downloads/mysql-3.23.html

Install it with default.

Usage:

- PathToMysql: bin/mysqld safe\$
- PathToMysql: *bin/mysql*
- Connect to Mysql: → mysql> connect yourdatabasename;
- Delete Table: \rightarrow mysql> *drop table* yourtablename;

You have to input ";" at the end of each command line. For MyCoRe Project developers, it is often to delete the following tables for new loading of classification:

- \rightarrow mysql> drop table mcrcateg;
- → mysql> drop table mcrcategabel;
- \rightarrow mysql> drop table mcrclass;
- → mysql> drop table mcrcalsslabel;

- → mysql> drop table mcrfsnodes;
- → mysql> drop table mcrlinclass;
- → mysql> drop table mcrlnkhref;
- Exit Mysql: \rightarrow mysql> *exit*;
- You can also install "Mysql Control Center" to have a overlook about the content of the tables (s. Figure 1: Mysql Control Center)

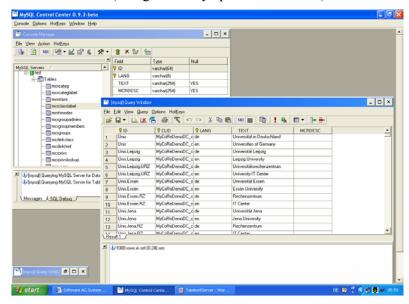

Figure 1: Mysql Control Center

- Ant Build: to do Ant Build about Mycore codes. Download Ant: 1.5.3-1, installation and usage can be referred to: http://www.apache.org/dist/ant/binaries/.
 - Make sure you set the ANT_HOME and path in your system environment variables.
- JDK 1.4: Download, installation and usage can be referred to: http:java.sun.com.
 - Make sure you set the JAVA_HOME and path in your system environment variables.
- Useful Command line Usage: e.g.: s.
 http://www-rohan.sdsu.edu/~corpora/corpus course/unix-commands.html

3 Preparing Mycore Codes

3.1 Check out/Download Mycore Codes:

Mycore zip file can be downloaded from http://www.mycore.de. If you are from a development's team and have to communicate with your community, you should checkout out mycore codes from CVS repository from http://www.mycore.de. You can choose one of the following methods to check out:

- Download Ant from http://www.apache.org/dist/ant/binaries/ and install_it. Check out mycoreby, e.g.,:
 - cvs-1.11.5 –d: pserver: <u>anoncvs@server.mycore.de:/cvs</u> checkout mycore
- CVS Checkout from JBuilder (s. Figure 2: CVS Checkout from JBuilder)

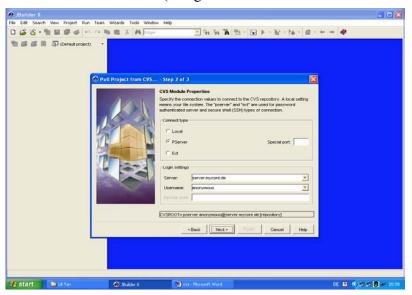

Figure 2: CVS Checkout from JBuilder

 CVS Checkout from SunOneStudio (s. Figure 3: CVS Checkout from SunOneStudio)

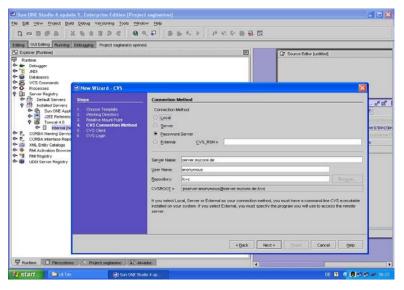

Figure 3: CVS Checkout from SunOneStudio

3.2 Configuration of Mycore Codes

• Point out XML store type and their path and name of Jar files in "build.properties" of the folder mycore/bin/, e.g.:

```
# Tamnio under Windows and Sun Solaris
MCR.XMLStore.Type=taminoxmldb
MCR.XMLStore.BaseDir=/sag/sun1/LibTaminoAddedtoMycore
MCR.XMLStore.Jars=tamino_xmldb.jar TaminoAPI4J.jar
```

Point out your schema path in "mycore.propertities", e.g.:

MCR.parser_schema_path=/sag/sun1/dlwww/mycore-sample-application/schema

• Switch the persistence configuration to XML Tamino DB features in "mycore.propertities.privates" file: e.g.:

MCR.persistence_taminoxmldb_database=tamino

• Point out your JDBC parameter to connecting to Mysql in "mycore.propertities.privates" file, e.g.:

```
MCR.persistence_sql_database_url=jdbc:mysql://localhost/test?user=ODBC
```

• Point out your internal file system filestore path in "mycore.propertities.privates" file, e.g.:

 $\label{local_model} \begin{tabular}{ll} MCR.IFS.ContentStore.FS.BaseDirectory=/sag/sun1/mycore-sample-application/filestore \end{tabular}$

4 Implementation Steps of Mycore Application

It is supposed that your Mycore application's environment are good prepared and mycore source code are ready configured. Implementation Steps show you how to use Ant build to compile sources codes and more until you get the web application of Mycore sample.

4.1 Ant Build MyCore Jar for Tamino DB

• Check and build Jar file in mycore path by:

```
ant info
ant clean
ant usage
ant JAR
```

4.2 Clean up Mysql and Tamino DB if needed

 Clean up Mysql and Tamino databse. If you are at the first time to buid Tamino Mycore sample application, skip this part and go directly to the next part.

Clean up Mysql:

cd SunSoarsisMachineName/ PathToMysql: bin/mysql

Connect to Mysql: → mysql> connect yourdatabasename;

Delete Table: → mysql> *drop table* yourtablename;

You have to input ";" at the end of each command line. For MyCoRe Project developers, it is often to delete the following tables for new loading of classification:

- → mysql> drop table mcrcateg;
- → mysql> *drop table* mcrcategabel;

- → mysql> drop table mcrclass;
- → mysql> *drop table mcrcalsslabel*;
- → mysql> drop table mcrfsnodes;
- → mysql> *drop table mcrlinclass*;
- → mysql> drop table mcrlnkhref;
- Exit Mysql: \rightarrow mysql> *exit*;

Clean up Tamino database, need only to perform:

ant clean.taminocollection.

Because a Java class has been developed, which plays special attention for convenience of the Mycore developers, allowing without going every once and while between mysql and ant.

Create databases for Mysql and Tamino with the names, which you have specified
in your private property file. Also you have to start the database in MySql and
Tamino before loading documents.

4.3 Loading Documents for Mycore Sample Application

Go to directory mycore-sample-application, perform:

ant info, check if paths OK

ant usage

ant schema

ant users

ant load.classifications

ant tamino, then all of the XML contents for persistence are to be loaded into Tamino.

You can also perform the followings to see every loading step in detail:

ant taminoschema

ant load.taminoschema

ant load.legalentities

ant load.documents

ant load.derivates.

4.4 Building and Deploy Web Application

• Build Web application / War File by:

ant webapp / ant war

You can either excute the web application with Sun One Studio. Or you can copy the war file "mycoresample" into a Tomcat directory "webapps". By stop and new start the Tomcat, you can achieve the Mycore sample application Mask via a browser in corresponding address, e.g., http://localhost:8080/mycoresample (s.Figure 3 Mycore-Sample-Application Search Mask).

Figure 4: Mycore-Sample-Application Search Mask

• Perform Search and Found Test:

e.g., Document search in Tamino (s. Figure 4: Mycore-Sample-Application with Tamino)

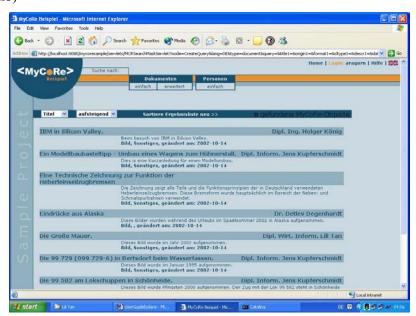

Figure 5: Mycore-Sample-application with Tamino
